

SCCS MRC Tissue/Pathology collection

PrimarySite	Total
Breast	734
Colorectal	402
Kidney and Renal Pelvis	80
Liver and Biliary	34
Lung	117
Oral and Pharynx	69
Pancreas	15
Prostate	335
Stomach	19
Others	52

Tissue Collection:

The SCCS maintains and continues to add to a tissue repository from incident cancer cases among SCCS participants. The majority of samples are from formalin fixed paraffin embedded tissue blocks from the primary tumor, and from adjacent normal tissue when available. All cases undergo centralized pathology review to ascertain tumor characteristics, in addition to the data from original pathology reports. Both slides (unstained and H&E) and tissue microarrays are available to investigators.
